
parallel and series combination of resistors experiment

## Purpose

(1) To study resistors connected in series
(2) To study resistors connected in parallel.
(3) To study resistors connected in series and parallel.

## Theory

Combinations of Resistors.
When two or more resistors ( R1, R2, R3,...) are connected in series (Fig. 1) then this combination is equivalent to a single resistor of resistance $\mathrm{R}_{\mathrm{eq}}$ given by equation (1).

When two or more resistors are connected in parallel (Fig. 3) then the equivalent resistance $\mathrm{R}_{\mathrm{eq}}$ is given by equation (3).

When three or more resistors are connected in both parallel and series combinations within the same circuit (Fig. 4) then the equivalent resistance $\mathrm{R}_{\mathrm{eq}}$ is given by using equation ( $2 \& 3$ ).

The voltage between the end of the resistors is dependent on the current flows throw it
